#4130 FW 5.1.07 SMS Not Received for WebdynSunPM Without SMS Keys

Statut : Resolved

In version 5.1.5, a WebdynSunPM without a factory SMS password and no SMS key configuration could successfully respond to unencrypted status SMS messages. After upgrading to version 5.1.6, the same device ceased to respond to these messages. This bug has been resolved, ensuring that a WebdynSunPM without a factory SMS key and without a user-defined password can still receive unencrypted SMS messages as expected.

#4131 FW 5.1.07

Encrypted SMS not received on WebdynSunPM with factory SMS configuration without first log-in

Statut : Resolved

The WebdynSunPM could not receive an encrypted SMS before the first log-in was achieved despite having a factory-configured SMS password and a valid SIM card. The expected behavior is that the device should automatically respond to encrypted SMS using the factory key after initial power-up, without requiring any user configuration during the first WEB connection.
